TM Floyd & Company Untangles an Integration Nightmare

Missed Deadlines, Uncontrolled Costs

For a client specializing in software development for healthcare providers, the acquisition of a competitor created new opportunities for growth if they could resolve an integration challenge. With the companies over 1,700 miles and two time zones apart, correcting cost overruns and missed delivery deadlines seemed impossible. They needed to bring their software development processes into alignment to get everyone on the same page.

Process Alignment

TM Floyd & Company rose to the challenge, taking on responsibility for management and development of a medical software suite installed and in use **at more than 1,200 healthcare centers nationwide**. Our expert analysis of the software development processes identified and resolved gaps that caused delays and missed implementations. We then collaborated with the sales teams to create a new product baseline and roadmap for moving forward.

Higher Product Standards

Helping with the transition of development from Utah to South Carolina, we implemented new coding standards with system development life cycle controls and improved source code versioning to create a model office environment with superior testing. Our efforts re-established product standards and documentation, enabling the client to achieve Certification Commission for Healthcare Information Technology accreditation for their electronic health records product.
